

where the little one is always upon its feet, as it were; tenth, the tyres of the double-spoked bicycle wheels are rubber, and therefore noiseless, whilst the wheels themselves are protected by a broad mud-guard, which also prevents the child getting its fingers into the spokes; eleventh, its price commends it to everyone, forty-five shillings being all that is charged for the best finished and painted car, carriage paid, to any place in the United Kingdom, just about half the price of a good perambulator; twelfth, it is easily oiled and kept clean; thirteenth, its appearance is everything that can be desired; fourteenth, but not by any means the least important, children as well as grown-up people can readily push it. We have put it to a thoroughly practical and rough test, and cannot possibly find a single fault in it. We feel sure that the "Victor Car" will be greatly appreciated by all those who have the good sense and discrimination to select it for the use of their little ones. In Hospitals and Convalescent Institutions, where there are children's wards, it would be found both useful and serviceable.

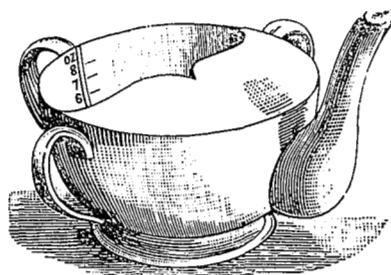

PARADOX DIGESTIVE SALT AND DIETETIC BISCUITS.—The former is a useful preparation which possesses in a marked degree the solvent powers of the digestive secretions, and when used—just in the manner of ordinary table salt—is a decided and beneficial aid to digestion. The salt does not differ much in appearance or taste to refined table salt, and is evidently carefully prepared. The Paradox Dietetic Biscuits contain meat in a marked proportion. These are of a very delicate flavour, and particularly serviceable to invalids and children. They are easily digested, exceedingly useful, and satisfactory. Both the salt and the biscuits are prepared by Messrs. Walter Thorp and Co., Norfolk Square, Glossop, and may be had in One Shilling tins.

FLITWICK NATURAL CHALYBEATE WATER is obtained from the well-known natural springs of Flitwick, in Bedfordshire. The water contains in perfect solution no less than 144 grains per gallon of oxide and carbonate of iron, and is therefore peculiarly adapted, under medical advice and direction, for anæmic and chlorotic patients. It is particularly palatable and eminently valuable as a ferruginous tonic. It can be obtained from the Flitwick Central Depot, 63, Borough High Street, S.E.

SANITARY UNDER-WEAR.—The Sanitary Knitted Corset Company, of 44, Mansfield Road, Nottingham, who supply their goods direct to the public, and who forward their lists and pattern cards

post free to anyone on application, have submitted to us specimens of their manufactures. Their merinos and pure wools are of the finest make, and are light and absorbent. They are in many shades, and thoroughly adaptable for all purposes of under-wear, both for Nurses, children, and adult invalids. At a time when the importance of proper under-wear cannot be too highly commended, those manufactured by this company come with special appropriateness. Their knitted corsets are already sufficiently well known as not to require any further testimony as to their excellence at our hands.

WHIGHAM'S IMPROVED GRADUATED FEEDING CUP has been made at the suggestion of Dr. Thomas M. Watt, of Hovingham. It is claimed for it that it is made with three handles, two for the use of the patient, and the one opposite the spout for the Nurse's use. The end of the spout is flattened, so that the lips of the patient can easily close over it, thus preventing any loss of fluid administered. The cup is graduated on the inside up to eight ounces, so that it may be seen at a glance how much has been taken by the

patient. It is a useful article, upon which the inventor is to be congratulated. Nothing is more noteworthy at the present time, both in Hospital and private practice, than the clumsy methods by which given quantities—most important in treatment—are administered to patients, with a total disregard to the medical attendant's ideas. This cup will obviate any difficulty of the kind, for it is simplicity itself. Messrs. H. Gilbertson and Sons are the manufacturers.

SALVINE—a dentifrice evidently manufactured with great care by its proprietors, 3, Oxford Street, W.—is certainly worthy of commendation. Its composition is such that it speedily removes tartar collected upon the teeth. It is satisfactory to know that there is nothing deleterious in its composition, and it should certainly recommend itself to general use. There is also another acquisition in its being "put up" in collapsible tubes; thus for cleanliness, and travelling purposes it is altogether advantageous.
