

Violence Risk Screening in the Emergency Department: Comparing the Predictive Validity of a Statistical Model to Nurses Clinical Judgment

#### Dr Cathy Daniel Prof Marie Gerdtz, A/Prof Stephen Elsom & A/Prof Jonathan Knott

- Supervisors Prof Marie Gerdtz, A/Prof Stephen Elsom,
- A/Prof Jonathan Knott.
- Panel Chair Professor Nick Santamaria, Professor Joy Duxbury, Roshani Prematunga
- Royal Melbourne Graduate Nurse Association
- "Jane Bell Award" 2011- refine and implement violence risk screening
- Nurses Memorial Centre "Australian Legion of Returned Servicemen and Women " 2011 and 2012 PhD Scholarship
- APA Scholarship 2013
- RMH Triage nurses who participated in observations
- ED Nurse Manager Liz Virtue
- Violence in ED Action Group
- Rebecca Waite ED Nurse Educator
- Di Frew- Community Representative

• Can an integrated decision support process for violence risk screening at triage be successfully developed and implemented?

• Can a statistical model be developed to identify who is at risk?

 Can triage nurses accurately identify who is at risk of violence on arrival?

## Literature

➢Alert system identified patients correctly but tool needed refining and prevention was required once at risk patients were identified (Kling et al., 2006).

≻ Reduction in violence was not sustainable (Kling et al., 2011).

➢Repetitively disruptive patients 96.1% reduction in violence- a flag system was used and focus on prevention N=48 (Drummond et al., 1989).

Stare, Tone, Anxiety, Mumbling and Pacing (Luck et al., 2007).

➢ Focus Groups, what do you do once a person is identified as at risk and how ED staff see levels of risk (Daniel & Gerdtz, 2009).

➢Wilkes (2010) Violence Risk Assessment Tool for ED, 17 observable items developed by Delphi technique, yet to evaluated. VAT (2014) observational study identified observable cues prior to assault.

## Method

Observation of Triage nurse practice (N=167)

### Consumer consultation (N=19)

Retrospective audit of Code grey data (N=1959)

#### Aims

1.Determine acceptability and useability

2. Integrate VRS into triage nurse practice

3. Compare 6 months matched data (Code Grey + Clinical)

THE EVOLUTION STARTS HERE

≻65.6% (623/950) arrived by ambulance

≻67.3% (639/950) were male

>37% (354/948) were allocated to the emergency stream

≻56.4% (536/950) had a triage category of 3

>37% (350/950) were referred for a mental health assessment

## Frequency of presentation, code grey response, and use of hospital alert

Presentation frequency	Patients	Code grey <sup>1</sup>	Use of hospital alert <sup>2</sup>
in 12 months	(N=857)	(N=1796) <sup>3</sup>	(N=25)
One presentation and one code grey	498	498	9
Two or more presentations requiring at least one code grey	105	577	11
One presentation with 2 or more code greys	254	721	5

THE UNIVERSITY OF

MELBOURNE

1. Code Grey is called by staff when they require security staff to attend to manage the potential or actual risk of clinical aggression

2. A hospital alert is added to a patients file when a risk is identified on previous admission

3. There were an additional 163 code greys that were not matched to a clinical presentation due to lack of information

		TI	HE EVOLUTION STARTS HERE		

L\_\_\_\_\_

- Triage nurses identify 56% of patients who will require a Code Grey on arrival and staff were forewarned of the risk of violence prior to 61% of Code Greys
- iPM alert use increased and resulted in staff being forewarned prior to 24% of Code Greys (<sup>1</sup> from 7%)
- Not all patients will have warning signs of violence
- Use of coercive interventions has increased—

- Is it quicker to restrain now and ask questions later?
- Significant reduction in the duration of Code Grey responses
- No<sup>↑</sup> in the number of Code Greys or presentations who required a Code Grey

### **Access to Clinical Care**

- No change in time from triage to review by mental health (p<.118).
- •Patients who have a Code Grey are seen more quickly by medical staff (p < .002).
- •LOS for patients who have a Code Grey has increased (*p*<.001).
- •Reduced frequency of Code Greys at triage following the introduction of violence risk screening (p<.001).
- •There was an significant increase in the median time from triage to the first Code Grey following the introduction of violence risk screening (p<.001).

- Not all violence/aggression will require emergency response =incomplete data, no severity measure
- Success depend on technology and usability
- Focus on ED only, yet there are other ward areas
- Identifying prevention strategies remains unknown

## Conclusion

>VRS is one strategy in an organisational approach for prevention

- ➢Risk factors for a Code Grey response have been identified
- >There are a small proportion of patients that account for several code greys

- Screening must be integrated into clinical practice-setting/population
- ➢Confirms the problem of violence in complex, and research and testing of interventions specific to ED is warranted
- >Potential to focus on cultural change and interventions such as Safewards

## Thank you
