Screening and Brief Intervention for Drug Use in the Emergency Department:

*Perspectives of Nurses and Consumers*

GERDTZ M, Yap C, Daniel C, Knott J.
Background

- The emergency department (ED) represents a **frontline point of access** for people with acute behavioral disturbances and concurrent illicit drug use.

- Differentiating the cause of acute behavioural disturbance in the ED is both complex and challenging, especially when behaviour threatens staff safety.

**Evidence**

**Research**
- The ED visit provides a potential window of opportunity for screening, brief intervention and referral to treatment (SBIRT) ³, ⁴
- Opportunity for a “teachable moment” ⁴

**Policy**
- Emergency departments should take every opportunity and be resourced to promote public health and the prevention of illness and injury…. (including). .. screening for drug and alcohol misuse, and undertaking brief interventions where appropriate.” ⁵

The Gap

• How can problematic drug use routinely be identified and treated among patients who present to the ED?

• What is the evidence regarding uptake and patterns of referral for those most at risk of harmful drug use?
Aims

1. To determine the prevalence of illicit substance use for all individuals admitted to the ED Behavioural Assessment Unit (BAU).

2. To explore perspectives of staff and consumers regarding routine drug screening and brief interventions for drug use.

Approach and Setting

Design
- Observational study of prevalence
- Focus group interviews with nurses regarding barriers and enablers to drug screening
- Consumer survey regarding public acceptability

Setting
- Metropolitan tertiary referral hospital ED
- 6 bed Behavioral Assessment Unit (BAU) co-located within the ED

Aim
Determine the prevalence of meth/amphetamine and cannabis use among individuals admitted to BAU.

Outcomes

1. the prevalence of amphetamine-type stimulants and cannabis use among patients using POC saliva testing and self-reported drug use.

2. Secondary outcomes were rate of acceptance and referral outcomes for patients who tested positive for, or who self-reported amphetamine-type and/or cannabis use.
Observational study (July-December 2017)

Approach
Prospective observational study

Participants
• All patients admitted to BAU over a 6 month period

Screening Brief Intervention Referral to Treatment \(^8, 9, 10\)

8. Securetec Drug Wipe® Twin
Results

Combined prevalence of meth/amphetamine and other drug use was 21.2%

85.6% accepted referral to the alcohol and other drug clinician

†Patient may report more than one illicit drug use

*Others drug use included diazepam, heroin, LSD, GHB, synthetic cannabis, nitrous oxide, cocaine
Focus Groups (August-October 2018)

Aim
• To explore perspectives of ED clinicians regarding drug SBIRT.

Approach
• Qualitative - thematic analysis

Setting
• Metropolitan tertiary referral hospital ED

Participants
• Nurses (30)
Results – 5 focus groups n=30

Barriers and enablers to SBIRT in the BAU exist at three levels:

- **Patient** (receptiveness to screening)
- **Staff** (knowledge and perceptions of role)
- **Systems** (time pressures, lack of established pathways to referral, communication between ED-AOD services)
Patient receptiveness

• “... sometimes I don't probe because you can see they’re getting agitated with you by asking the questions, you're increasing their behaviours and potentially become more dangerous and escalated ...”

• “...I think it's a bit touchy with some people because people get quite defensive about it, not because they’ve taken it, but because they can’t believe that you're going to ask them that question, so you kind of don't want to get off on the wrong foot with your patient...”
Results – barriers to SBIRT (Staff)

Knowledge

• “... we don't have a skill set for that, and so you think that it's not your role, you think that is actually an important conversation and I don't want to go in there and give the wrong information, so I’m just going to step back from that...”

Role delineation

• “I don't know if that changes the patient care...which again makes me wonder if ED is the right point at which to do how much of the work...”
Results – barriers to SBIRT (Systems)

Time pressure
• “... so often we don't ask, because you get so pushed just to do the work and get them out, the 4 hour rule screws everything...”

Pathways to referral
• “when you come to behavioural drug affected patients, there's no pathway, there's no guideline, there's no nothing. So no one really knows what to do...”

Collaborative approach to ED-AOD services
• “...on the Friday, they're on a bender...and they will say, ok, just refer to drug and alcohol, but, there's no drug and alcohol so we’ll put in an after hours referral and it's like I don't know what's going to be and is that collected? Is that being followed up?”
Results – Enablers to SBIRT (Staff and systems)

Knowledge
• “...if you were to empower the nurse with sort of information on harm minimisation strategies and effects of illicit substances, nurses would go oh wow I’m allowed to say things like that. Because it's very formal, it's extremely factual, it would be amazing...”

Collaboration
• “…it’d be good for us to clarify if we make a referral will AOD clinician follow up these high risk out of hours, just I think communicating that to all the nurses will increase your compliance for referrals…”

Resources
• “If we just have a brochure we have some simple information we can give them...we can give them something that they can hold onto and take with them...”
Consumer survey (March-April 2019)

Aim
• To explore perspectives of ED consumers regarding drug SBIRT.

Participants
• English speaking adults with no symptom distress or cognitive impairment and able to provide written consent

Setting Sample
• Metropolitan tertiary referral hospital ED
• Random stratified sample (by location) of 20 participants per day
Survey

Patient Beliefs and Attitudes Survey

- 11 items measured on 5-point Likert Scale indicating level of agreement
  - Appropriateness
  - Thoughts
  - Level of comfort
  - Relevance/importance to visit
  - Preferences

These questions ask about attitudes towards Alcohol and Drugs screening in the Emergency Department.

Mark your level of agreement with the following statements:

<table>
<thead>
<tr>
<th>Strongly disagree</th>
<th>Disagree</th>
<th>Neutral</th>
<th>Agree</th>
<th>Strongly Agree</th>
</tr>

Results

Identification

467 randomly selected

113 excluded (24.2%)

Inclusion

353 included (75.8%)

86 refused (24.3%)

268 consented (75.7%)

7 incomplete (2.6%)

Analysis

261 consented (97.4.7%)
Results (N=261)

- 85% it is appropriate it is to be questioned about substances
- 88% comfortable answering questions about substance use
- 89% agree it is important for staff to know about substances use
- 80% believe it’s a good idea to screen everyone
Key points

• **The prevalence of illicit substance** use among individuals admitted to BAU unit is **high**.

• **Most patients** who screened positive for illicit drug use were **willing to be referred to AOD clinician**.

• The ED visit represents a window of **opportunity in which nurses can screen for drug use, implement education regarding harm minimisation, and make referral to AOD services**.

• Key challenges for clinicians in initiating SBIRT are related to **time pressures, role legitimacy and lack of training**.

• The vast majority of the consumers who were interviewed felt it was **appropriate to be questioned about drug use and were comfortable answering questions** related to this during their ED visit.
