The RCN Women’s Health Forum
Fertility Preservation

Fertility preservation involves freezing and storing sperm or eggs (gametes), ovarian reproductive material or embryos for use in a person’s future fertility treatment.

Techniques for storing gametes and embryos are now well established and progress has also been made with the preservation of ovarian and testicular reproductive material.

Good quality information, informed consent and appropriate counselling are critical before preservation can begin, but it must be managed early.

**Legal and regulation issues**

Storage and the use of gametes and embryos falls under the regulatory remit of the Human Fertilisation and Embryology Authority (HFEA), which also provides information about HFEA licensed fertility centres across the UK.

The main legislation around fertility preservation is:
- Human Fertilisation and Embryology Act 1990 (amended) (HFE Act)
- Human Tissue Act 2004, use and storage of ovarian and testicular reproductive material

**Reason for preserving fertility**

- Medical – life limiting disorders
- Transgender reassignment
- Social/economic – wishing to delay becoming pregnant

**Resources**

RCN (2017) *Fertility Preservation*

www.rcn.org.uk/professional-development/publications/pub-005986
Infertility is defined by WHO (2018) as the failure to achieve a clinical pregnancy after 12 months or more of regular unprotected sexual intercourse.

About 80% of couples will conceive naturally, however 1:7-8 women across the globe will have difficulty and require treatment for infertility. There are also non-medical reasons for choosing fertility care, including same sex individuals/couples or transgender people who seek infertility care, or those who choose to defer their child bearing until a suitable time for them.

**Causes**

- 1/3 male associated physiology
- 1/3 female related physiology
- 1/3 other (e.g. single women/same sex relationships)/unknown causes

**Options**

- Some people will choose not to pursue treatment
- People who ask for medical advice should have appropriate investigations and referral to a fertility specialist, and if indicated follow a care pathway based on the NICE guideline
- For some, a technical solution is the option, via reproductive technologies to achieve a pregnancy, this may be in the form of IVF (In vitro fertilisation) or similar techniques
- This may require the use of donor gametes
- Fostering or adoption may be an option and information should be provided
- Surrogacy may be an option in some cases
Mental Wellbeing and Fertility

Confirming infertility or accessing and using treatment options can be an emotional rollercoaster, requiring the right level of support and counselling at the right time. All health care professionals should be aware of people’s emotional as well as clinical needs.

All assisted conception clinics in the UK are legally required to offer their patients information and support counselling and the counsellors are expected to be accredited by the British Infertility Counselling Association or equivalent.

### Resources

- The British Association for Sexual Health and HIV - BASHH Guidelines [www.bashh.org/guidelines](http://www.bashh.org/guidelines)
Pelvic Inflammatory Disease (PID)

PID is inflammation of the reproductive organs.

- Usually caused by a bacterial infection
- Caused by sexually transmitted infection in \( \frac{1}{4} \) of women. Most commonly chlamydia, gonorrhoea, or mycoplasma genitalium
- Left untreated, can lead to pelvic scarring, pelvic abscess and infertility

**Symptoms**
- Lower abdominal pain
- Deep pain during sex (dyspareunia)
- +/- Abnormal vaginal bleeding
- Abnormal vaginal discharge
- Fever or feeling unwell
- May be asymptomatic

**Diagnosis**
- Sexual health history
- Full sexual health screen including tests for mycoplasma genitalium and blood borne viruses
- Bimanual examination
- Urine test to exclude pregnancy and urinary tract infection

**Management**
- 2 weeks antibiotics, analgesics and rest
- Abstain from any sexual contact for 2 weeks
- Partner notification & treatment
- Patient information, support, encourage safer sex
- Follow up in 2-4 weeks
- Admission for intravenous antibiotics if pregnant, severe symptoms or complications
- Pelvic scanning and specialist treatment required if acutely unwell or non-responding to treatment

**Resources**
Polycystic Ovarian Syndrome (PCOS)

Endocrine condition with gynaecological and metabolic elements (affects ovaries, uterus, liver and adrenals) with multiple presentations affecting up to 10% of women of reproductive age.

- Harder to diagnose in young girls who have just started periods
- Unknown causes, possible genetic link, fetal exposure to androgens
- Multiple small follicles with persistently high Luteinising Hormone (LH), which inhibits ovulation, leading to high androgens

**Differential diagnosis**
- Thyroid dysfunction
- Pituitary tumours
- Premature ovarian insufficiency
- Hypogonadotrophic hypogonadism – in women with anorexia/excessive exercise
- Drug use
- Rare endocrine e.g. adrenal hyperplasia

**Signs and symptoms**
- None
- Irregular/no periods (70%)
- Infertility
- Increase in hair - hirsutism (70%)
- Male pattern baldness (5-10%)
- Acne (15-25%)
- Weight gain and obesity (45%)

**Diagnosis - 2 of the following**
- Menstrual disturbance - infrequent or no periods
- Androgen symptoms
- PCO seen on scan

Supported by verity

sharing the truth about PCOS
### Treatments (Depends on the presenting symptoms)

Lifestyle advice: weight management (ovulation after 5-6% weight loss) and benefit on CVD (cardiovascular disease) and long term health.

1. Possible fertility referral for ovulation support
2. Hair/skin may need an endocrine/dermatologist referral
3. Endometrial protection and periods - IUS or cyclical progestogens to ensure 3-4 withdrawal bleeds per year to prevent hyperplasia
4. Weight loss
5. Combined Oral Contraceptive Pills - androgen side effect and endometrial protection
6. Metformin alone – not recommended - limited evidence (NICE)

Increased risk of:
- poor self esteem
- depression
- CVD/ metabolic syndrome
- fertility issues
- sleep apnoea
- poor reproductive outcomes
- diabetes
- non-alcoholic fatty liver
- endometrial cancer

Pre-menstrual Syndrome (PMS)

A chronic cyclical condition, with multiple symptoms that occurs in the luteal phase (second half) of the menstrual cycle. 40% of women experience PMS symptoms and of these 5-8% will suffer severe PMS.

**Symptoms may be psychological and physical**
- Depression and anxiety
- Loss of confidence
- Mood swings
- Food cravings
- Irritability
- Mastalgia
- Bloating
- Change in sleep pattern

**Cause**
Causes of PMS is not known but some women have progesterone sensitivity, this may be due to a reduction in the neurotransmitters serotonin and gamma-aminobutyric acid.

**Diagnosis and management**
A PMS diagnosis is dependent on the timing of symptoms rather than the character of the symptoms. The degree of impact on the woman’s daily life must be considered and the symptoms should cause significant impairment during the luteal phase of the menstrual cycle (before period) to establish a diagnosis. Symptoms should resolve within a few days of menstruation commencing. A symptom diary should be used prospectively for at least two cycles.
Pre-menstrual Syndrome (PMS)

Treatments
Lifestyle changes - exercise and reducing caffeine, alcohol, salt, sugar and simple carbohydrates.

1st line treatments include combined oral contraceptive pill (COC), Vitamin B6 or low dose selective serotonin reuptake inhibitor (SSRIs) antidepressants and cognitive behavioural therapy. Drospirenone-containing COC should be considered as a first line pharmacological intervention and should be used continuously rather than cyclically.

2nd line treatments include estradiol patches with micronized progesterone or Levonorgestrel intrauterine system, or higher dose SSRIs.

3rd line includes gonadotropin-releasing hormone analogues with add-back hormone replacement therapy (HRT) (continuous combined).

4th line surgical treatment +/-HRT.

National Association for Pre-menstrual syndrome
www.pms.org.uk

Pelvic Organ Prolapse

- Affects 50% of parous women.
- Risk of prolapse doubles with each completed decade of life.

### Risk factors

- Chronic constipation – straining
- Chronic cough
- Childbirth and pregnancy
- Family history – increased risk if mother/aunt had a prolapse
- Hysterectomy – vault prolapse, cystocele, rectocele
- High impact exercise – trampolining, running

### Treatments

- Pelvic floor exercises – don’t cure prolapse, strengthen the muscle to help relieve symptoms
- Pessary – different types. Use whilst waiting for surgery, whilst family not complete, if surgery not suitable
- Surgery – hysterectomy, anterior/posterior repair, sacrospinous fixation, 30% recurrence rate following surgery

### Symptoms

The RCOG Patient information leaflet has useful diagrams.
Pelvic Organ Prolapse

Pessaries
Many different types for different prolapses. Ring and gelhorn most commonly used.

![Gelhorn](image1.png) ![Ring](image2.png)

Changing the pessaries
- 4-6 monthly
- Can notice increased vaginal discharge
- Observe vaginal tissue quality with speculum
- If bleeding or ulceration – leave pessary out and treat with topical vaginal oestrogens, replace pessary after one month
- If tissues atrophic consider low dose topical vaginal oestrogen such as vagifem, twice weekly
- If any post-menopausal bleeding – refer to rapid access clinic for ultrasound scan to check endometrial thickness
- Self-management – option for dexterous women, remove, wash and replace as needed
- May not always find correct size at first fitting

Resources
RCOG (2018) Menopause and women’s health in later life

Pelvic Floor Exercises (PFE)

Stronger pelvic floor muscles help to reduce symptoms of stress incontinence and an overactive bladder.

Pelvic floor exercises strengthen the muscles around the bladder, vagina, and anus.

It is essential that women know which muscles to contract - vaginal examination assessing squeeze.

Regularity is key - ideally needs to be three times a day. Maintenance – once daily.

Using a Valsalva manoeuvre (push down) will make pelvic floor weaker.

How to do the exercises

- PFE can be done lying, sitting or standing. Lying is easiest, standing most difficult
- Squeeze the muscle as if trying to stop the flow of urine and as if trying to stop passing wind
- Squeeze up, NOT push down
- Fast contractions – aim for 10 repetitions
- Slow contractions – aim for 10 repetitions, holding for 10 seconds – do less if this feels too much
- Relax muscle fully in between contractions, do not use the stomach muscle
- To check – woman can put finger in vagina to feel a squeeze, or finger on perineum to feel a lift
- Any push down is not advised
- Do not encourage women to stop the flow of urine, this can create issues with voiding and possible reflux, and is now considered outdated
Pelvic Floor Exercises (PFE)

Devices
Many different types for different prolapses. Ring and gelhorn most commonly used.

- Electrical stimulation machines. For those with little or no contraction
- Intra vaginal supports (more popular since suspension of mesh procedures) – ring with knob, diveen, uresta, contiform, incostress
- Squeezy app from app store- will provide reminder to do the exercises regularly
- Elvie personal trainer – biofeedback device – available on NHS

Referral to
Women’s health physiotherapist or urogynaecology Clinical Nurse Special for assessment if not sure technique is correct.

The vulva is the external female sex organs and includes the urethral opening and anus. There are a wide range of conditions that can cause symptoms, but the common ones are listed below.

**Symptoms**
- Itching – most common presenting symptom
- Pain – including soreness, discomfort and dyspareunia
- Discharge
- Change in appearance – including colour change or loss of anatomy
- Presence of a lump/lesion

**Conditions**

<table>

<tr>
<td>Vulvodynia</td>
<td>Pain frequently felt at the introitus when touched during sexual intercourse or on insertion of tampons. Sometimes pain may be spontaneous. The vulva looks normal.</td>
</tr>
</tbody>
</table>
Benign Vulval Disorders

Diagnosis and management
The majority of benign vulval disorders can be diagnosed with a detailed history and full examination of the vulva. A biopsy may be taken if a lesion is present. Women should be given a diagnosis, information about their condition and basic skin care (e.g. avoidance of irritants).

Incidence
Currently the incidence of many vulval disorders in the UK is unknown but LS is estimated to affect up to 3% of adult females.

Treatments
Topical treatments include topical steroids, antiseptics, antibacterials and antifungals. For symptomatic patients, emollients (to keep skin hydrated and to act as a barrier) and good skincare (avoiding wet wipes, talcum powder, urine) will benefit many.

For LS and dermatitis effective treatment is with the regular, appropriate application of strong steroid ointments (to suppress skin inflammation such as clobetasol propionate). Steroid thinning is uncommon.

Vulvodynia patients may need a holistic approach. Cognitive behavioural therapy, psychosexual counselling, perineal massage, pelvic floor muscle physiotherapy, topical lidocaine and oral neuromodulators such as amitriptyline or pregabalin may help.

Types

- Endometrioid adenocarcinoma (most common)
- Mucinous adenocarcinoma
- Serous adenocarcinoma
- Clear cell adenocarcinoma
- Undifferentiated carcinoma (large/small cell types)
- Carcinosarcoma
- Squamous adenocarcinoma
- Mixed carcinoma
- Metastatic carcinoma

Diagnosis

Investigations including: pelvic examination, ultrasound scan, an endometrial biopsy or a hysteroscopy and biopsy

Diagnosis is confirmed following a biopsy result, which will provide the grade of the cancer, a MRI and CT will be organised to ascertain the stage of the disease in order to plan treatment with the multidisciplinary team.
Cancer of the Endometrium

Treatments
Treatment for early stage endometrial cancer involves surgery, laparoscopically or open.

Surgery: Total hysterectomy +/-bilateral salpingo oophorectomy +/- bilateral pelvic lymph node dissection +/- para-aortic lymph node dissection +/- omentectomy

Women with more advanced disease may be offered further treatment after surgery:
• External beam radiotherapy  • Internal brachytherapy  
• Chemotherapy

Women with recurrent and metastatic disease can be treated with hormones or palliative radiotherapy to control their symptoms.

Side effects of treatment
• Lymphoedema  
• Induced menopause  
• Late gastrointestinal effects on bowel +/- bladder  
• Vaginal stenosis  
• Shortened vagina  
• Body image/sexual issues  
• Loss of fertility  
• Peripheral neuropathy  
• Fatigue

</tbody>
</table>

**Diagnosis**
Examination, CA125 (blood tumour marker), ultrasound scan, CT, ascitic fluid aspiration, image guided biopsy, surgery.

Treatment plans are made in a multi-disciplinary setting (MDT) depending on the stage/grade/type.

**Types**
- Serous (most common)
- Mucinous
- Clear cell
- Undifferentiated
- Teratoma
- Granulosa Cell Tumour (GCT)
Cancer of the Ovary

Similar Cancers - primary peritoneal and fallopian tube cancer are diagnosed and treated similarly to ovarian cancer.

Treatments

**Early stage cancers**
Borderline tumours or early stage ovarian cancer can usually be cured with surgery.

Early stage clear cell, high grade serous or stage 1c are usually offered chemotherapy after surgery (adjuvant).

Some women with early stage disease may be offered fertility sparing surgery.

**Advanced Ovarian Cancer**
Treated with surgery and chemotherapy, this can be pre or post-surgery. Chemotherapy may be the main treatment used to palliate and control symptoms.

Surgery usually involves: Total Abdominal Hysterectomy, with Bilateral Salpingo-oophorectomy, and Bilateral Pelvic and para aortic Lymphadenectomy, and Omentectomy, +/- Bowel resection (in some cases).

Resources

RCOG (2016) *Patient Information leaflet on Ovarian cancer*  

NICE (2011) *Ovarian cancer: recognition and initial management*  
www.nice.org.uk/Guidance/Cg122
An ectopic pregnancy is one that develops outside of the uterus; commonly in the fallopian tube.

**Incidence** – 1 in 80 pregnancies, and is a leading cause of death in early pregnancy.

**Risk factors**
- Previous ectopic pregnancy – 10% chance of subsequent ectopic
- Fertility treatment
- Pelvic inflammatory disease or chlamydia
- Abdominal or tubal surgery
- Endometriosis
- Smoking
- Increased risk following contraceptive failure with progestogen-only pills and intrauterine devices
- A third have no known risk factors

**Symptoms**
- May occur from 4-12 weeks gestation or later
- Vary and can resemble other conditions, e.g. gastrointestinal conditions, miscarriage, UTI

**Key symptoms**
- Missed/late period
- Abdominal/pelvic pain
- Bladder/bowel problems
- Shock or collapse
- Vaginal bleeding
- Shoulder tip pain
- Usually a positive pregnancy test

**Diagnosis**
- Clinical assessment
- Trans-vaginal ultrasound scan
- Serum human chorionic gonadotropin (hCG) levels
Ectopic Pregnancy

**Treatment** is dependent on clinical presentation and hCG level:
- Surgical management
- Medical management with Methotrexate
- Expectant management (active monitoring)

Anti-D prophylaxis for rhesus negative women who have a surgical procedure.

**Future considerations**
- Avoid conception for two menstrual cycles after treatment
- Women treated with Methotrexate should wait until hCG level <5mIU/mL, then take folic acid for 12 weeks before trying to conceive
- Women to be scanned at six weeks gestation in future pregnancies
- Consider the need for emotional support
- Signpost women to the Ectopic Pregnancy Trust for information and support

**Resources**
Ectopic Pregnancy Trust [www.ectopic.org.uk](http://www.ectopic.org.uk)
Association of Early Pregnancy Units [www.aepu.org.uk](http://www.aepu.org.uk)
NICE (2012) *Ectopic pregnancy and miscarriage: diagnosis and initial management* [www.nice.org.uk/guidance/cg154](http://www.nice.org.uk/guidance/cg154)

Supported by [The Ectopic Pregnancy Trust](http://www.ectopic.org.uk)
**Gestational Trophoblastic Disease (GTD)**

GTD (previously called molar pregnancy or hydatidiform mole) is an abnormal development of the trophoblast layer of the placenta (approximately 1 in 600 women). Women diagnosed with GTD need follow-up as there is a risk that the condition progresses to Gestational Trophoblastic Neoplasia (GTN).

### Types
- **Complete hydatidiform mole** - genetically abnormal pregnancy; no fetus develops (1:1000). 15% progress to GTN
- **Partial hydatidiform mole** - genetically abnormal pregnancy; abnormal fetus starts to form but unlikely to survive (3:1000). 0.5% progress to GTN
- **Invasive** - trophoblastic cells occur when a molar pregnancy invades into the myometrium.
- **Choriocarcinoma** - malignant disease, 50% occur after a molar pregnancy
- **Placental site trophoblastic tumour** - malignant disease - very rare; occurs more commonly after non-molar pregnancies

### Risk Factors
- Age - more common in teenage women and women over 45
- Ethnicity – twice as common in women of Asian origin
- Previous GTD – 1 in 80 chance of another GTD episode

### Symptoms
- Vaginal bleeding (80%)
- Hyperemesis (10%)
- No symptoms presenting at the first booking appointment
- Uterine enlargement (25%)
- Hypertension (1%)

### Detection
- Overall Detection rate via ultrasound is 44%
- 90% of complete moles are diagnosed on ultrasound scan compared to 30% of partial moles
- Histopathology diagnosis required in all cases as other methods are unreliable
**Gestational Trophoblastic Disease (GTD)**

**Management**

Suspected GTD

⇒ Surgical management only

(\text{Anti D prophylaxis if Rhesus negative})

⇒ Histology

⇒ GTD diagnosed

⇒ Refer to Regional Trophoblastic Disease Centre (RTDC)

**Reproductive Considerations**

- Women await RTDC discharge instructions – once clear it is safe to try for another pregnancy
- Barrier methods of contraception advised until safe to conceive
- Some women may require RTDC follow-up post any subsequent pregnancies, independent of pregnancy outcome

**Resources**

Association of Early Pregnancy Units [www.aepu.org.uk](http://www.aepu.org.uk)

Sheffield Trophoblastic Disease Centre [http://stdc.group.shef.ac.uk](http://stdc.group.shef.ac.uk)

Cysts are seen on ultrasound and vary in size, they can be fluid filled (simple) or be solid and contain solid material, blood or have compartments (complex).

**Types**

**Functional**
- Corpus luteal: 2-3 cm fluid filled sac. An egg is released at ovulation forming a corpus luteum.
- Functional ovarian cysts: follicle doesn’t rupture to release the egg. They are usually large, asymptomatic and resolve without treatment.

**Non Functional**
- Haemorrhagic cysts - bleeding within the follicular cyst. A rescan in 4-6 weeks should ensure it’s resolved.
- An endometrioma - ‘chocolate cysts’ filled with old blood. They cause significant pain and don’t resolve without treatment (see endometriosis)
- Benign germ cell tumours ‘dermoid’ cysts - contain hair, bone and fat and as they develop in size they are associated with a risk of torsion. Usually occur in young women with a 2-3% risk of malignancy.

**Signs and symptoms**
- Symptomatic or asymptomatic
- Unilateral or bilateral dull, sharp, constant or intermittent pain
- Sudden severe sharp pain if rupturing
- Severe pain along with vomiting if torsion
Ovarian Cysts

Investigations

- Vaginal and bimanual examination
- A transvaginal ultrasound scan
- Consider a pregnancy test
- CA 125 (blood test – tumour marker) in postmenopausal women or if malignancy suspected

Treatment

Premenopausal women:

- <5cm – treatment is not needed
- 5 – 7 cm – ultrasound follow up
- A simple cyst of 7cm – further imaging, MRI +/- surgery

Postmenopausal women:

- rescan in 4-6 months if <5cm
- surgery recommended for ovarian cysts >5cm

Resources

RCOG (2016) The management of ovarian cysts in postmenopausal women. Green top guideline 34
www.rcog.org.uk/en/guidelines-research-services/guidelines/gtg34

Women are twice as likely as men to be diagnosed with a mental health problem.

53% of women who have mental ill-health have experienced violence/abuse or post traumatic distress syndrome (affects over 31% of population).

**Impacts on mental well-being include:**
- feelings, thoughts and actions
- physical health, wellness and experiences
- education and employment
- social/family relationships
- economic and social circumstances
- lifestyle choices

**Types**
- Generalised anxiety disorder (GAD), social anxiety, panic disorder, obsessive-compulsive disorder (OCD)
- Severe mental health problems include:
  - depression
  - psychosis and bipolar disorders
  - autistic spectrum disorders
  - personality disorders
  - attention deficit hyperactivity disorder
- Suicide and self-harm
- Perinatal mental health (PMH) - mental health during pregnancy and the first postnatal year. Characterised by an existing mental health issue or a condition that arises during pregnancy:
  - antenatal depression
  - postpartum:
    - maternity blues, affects 80%
    - postnatal depression, affects 10%
    - puerperal psychosis, rare but severe psychiatric illness
Women and Mental wellbeing

As you enquire ‘how are you feeling? Consider asking the following supplementary questions:

- Do you take time to look after yourself?
- How are you coping?
- Do you feel low?
- Are you sleeping poorly?
- Are you not eating properly?
- Are you tearful, angry and/or anxious?
- Do you have concerns about your mental health?
- Do you have anyone to talk to about your concerns and what impact is this having?

This should lead to a diagnosis of mental wellbeing as well as physical health.

IDENTIFY > DIAGNOSE > EARLY INTERVENTION > APPROPRIATE CARE > AFTER CARE

Amenorrhoea

Types of amenorrhoea
Primary amenorrhoea (0.3%) failure to establish menstruation
• by 16 years of age with normal secondary sexual characteristics
• Pathological causes: genito-urinary malformation or androgen insensitivity syndrome (AIS)
• by 14 years with no secondary sexual characteristics
• Pathological causes: Turner’s syndrome or hypothalamic-pituitary dysfunction
• Other causes: pregnancy or constitutional growth delay (BMI below 19)
Secondary amenorrhoea (3%) absence of menstruation for six months or more after previously normal regular periods.

Causes
• polycystic ovarian syndrome (28%)
• premature ovarian insufficiency (12%)
• hypothalamic amenorrhoea (34%)
• hyperprolactinaemia (14%)
• pregnancy
• anatomical factors (7%)

Investigations
• clinical history
• imaging
• follicle stimulating hormone and luteinising hormone
• oestradiol
• physical examination
• thyroid function
• prolactin
• androgen concentration

Treatments
• Most girls with primary amenorrhoea will be referred to secondary care
• For secondary amenorrhoea treat as per diagnosis and refer as required.
• Refer if the woman is concerned about fertility
